A, Title: Analysis of the 3' region of the sheep elastin gene.
A, Reference number: A24758; MUID:85305763; PMID:3839997
A, Accession: A24758
A, Molecule type: mRNA
A, Residues: 655-669, 671-716, 732-770 < YOO>
C, Superfamily: elastin
C, Keywords: alternative splicing; extracellular matrix; glycoprotein; hydroxylysine F;760-765/Disulfide bonds: #status predicted

Biophys. Acta 1473:363-375(1999).

-!- FUNCTION: THE KEY ENZYMATIC REACTIONS IN NITROGEN FIXATION ARE CATALYZED BY THE NITROGENNES COMPLEX, WHICH HAS 2 COMPONENTS: THE IRON PROTEIN AND THE MOLYBDENUM-IRON PROTEIN.

-!- CATALYTIC ACTIVITY: B reduced ferredoxin + 8 H(+) + N(2) + 16 ATP = 8 oxidized ferredoxin + 2 NH(3) + 16 ADP + 16 phosphate.

-!- COPACION: BINDS ONE 4FE-45 CLUSTER PER DIMER.
-!- SUBUNIT: Homodimer (By similarity).
-!- SIMILARITY: BELONGS TO THE NIFH / BCHL / CHLL FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

"A novel melanocortin 4 receptor (MC4R) gene mutation associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -1- SUBCELLULAR LOCATION: Integral membrane protein.
-1- TISSUE SPECIFICITY: BRAIN, PLACENTAL, AND GUT TISSUES.
-1- DISEASE: Defects in MC4R are a cause of autosomal dominant obesity [WIM:601663].
-1- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
"Localization of the melanocortin-4 receptor (MC4-R) in
neuroendocrine and autonomic control circuits in the brain.";
Mol. Endocrinol. 8:1298-1308(1994).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CYTOPLASMIC (POTENTIAL).

1. Biol. Chem. 267:5442-5445 (1992).

1. Biol. Chem. 267:5442-5445 (1992).

1. FUNCTION: PARTICIPATES IN THE REGULATION OF THE ACCUMULATION OF ITS OWN MRA.

1. MISCELLANEOUS: THERE ARE TWO GENES FOR L4 IN YEAST.

1. SIMILARITY: BELONGS TO THE L4E FAMILY OF RIBOSOWAL PROTEINS.

DOR NO DE LA LEGISTA DE LA LEG ò This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation the European Bioinformatics Institute. There are no restrictions on its use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch). ò Dev. Dyn. 206:379-390 (1996).

1. Dev. Dyn. 206:379-390 (1996).

2. FUNCTION: INVOLVED IN THE TRANSCRIPTIONAL REGULATION OF GENES

3. REQUIRED FOR MESODERN DIFFERENTIATION. PROBABLY PLAYS A ROLE IN

3. LIMB PATTERN FORMATION.

4. SUBJECTIOLAR LOCATION: Nuclear (Potential).

5. STREES PECIFICITY: IN ADULTS, HIGHEST LEVELS IN LUNG. ALSO FOUND

5. IN HEART, KIDNEY, AND OVARY.

6. IN BEART, KIDNEY, AND OVARY.

7. IN EVALOARIST STAGE: EXPRESSION FIRST OBSERVED AT DAY 9.5 IN

7. THE OTIC AND OPTIC VESICLES AND IN THE FACIAL REGION. AT DAY

7. STREESSED IN THE TRIGEMINAL GANGLIA, FACTAL REGIONS, RETINA

7. THE DILK LINB BUD MESENCHYME. IN LATER STAGES, FOUND IN EAR PINNAE,

7. THE MILK LING MESENCHYME, BODY WALL. GENITAL RIDGE AND

7. DEVELOPING NERVOUS SYSTEM.

7. SIMILARITY: CONTAINS I T-box domain. SEQUENCE FROM N.A., AND DEVELOPMENTAL EXPRESSION.

SECUENCE OF 905-1057 FROM N.A.

STRAIN=CV. Alaska;
SUBMITTED OF THE GLEAVAGE SYSTEM CATALYZES THE degradation of Glycine. The glycine cleavage system catalyzes the degradation of Glycine. The Protein binds the alpha-amino group of glycine through its pyridoxal phosphate cofactor; CO(2) is released and the remaining methylamine modety is then transferred to the lipoamide cofactor of the H protein.

CATALYTIC ACTIVITY: Glycine + lipoylprotein = S-aninomethyldihydrolipoylprotein + CO(2).

STRAIN-COFACTOR: Pyridoxal phosphate.
STRAIN-COFACTOR: Pyridoxal phosphate.
SUBCELLULAR LOCATION: Mitochondrial.
STRAIN-FROTEIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This SWISS-PROT entry is copyright. A method for the large-scale cloning of nuclear proteins and nuclear

trargeting sequences on a functional basis.";

Anal. Blochem. 284:231-239 (2000)

- 1- FUNCTION: Insulin-regulated facilitative glucose transporter.

- SUBUNIT: Binds to DAXX (By similarity).

- 1- SUBUNIT: Binds to DAXX (By similarity).

- 2- SUBCELLUTAR LOCATION: Integral membrane protein. Localizes

primarily to the perinuclear region, undergoing continued

recycling to the plasma membrane where it is rapidly

reinternalized. The dileucine internalization motif is critical

for intracellular sequestration (By similarity).

- 1- STMILARITY: BELONGS TO THE SUGAR TRANSPORTER FAMILY. GLUCOSE

TRANSPORTERS SUBFAMILY.

Direct Submission
Submission
Submission
Submitted (27-MAR-2001) Whitehead Institute/MIT Center for Genome
Research, 320 Charles Street, Cambridge, MA 02141, USA
On Mar 14, 2001 this sequence version replaced gi:12958053.
All repeats were identified using RepeatMasker:
Smit, A.F.A. & Green, P. (1996-1997)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               * NOTE: This is a 'working draft' sequence. It currently consists of 18 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as * runs of N, but the exact sizes of the gaps are unknown. * This record will be updated with the finished sequence as soon as it is available and the accession number will * be preserved.
                            Sequencing vector: M13, 98%
Sequencing vector: plasmid; 2%
Chemistry: Dye-primer ET; 98% of reads
Chemistry: Dye-terminator Big Dye; 2% of reads
Assembly program: Phrap; version 0.990319
Consensus quality: 108825 bases at least Q40
Consensus quality: 202103 bases at least Q30
Consensus quality: 203934 bases at least Q30
Consensus quality: 203934 bases at least Q30
Consensus quality: 203934 bases at least Q20
Insert size: 219000; agarose-fp
Insert size: 206730; sum-of-contigs
Quality coverage: 4.27 in Q20 bases; sum-of-contigs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1761: contig of 1760 bp in length
